# How to Install Python and VPython

To run this 3D simulation, you need to install **Python** and a 3D drawing tool called **VPython** on your computer. Please follow these easy steps.

## Step 1: Install Python

If you don't have Python installed on your computer, follow these steps:

1. Go to python.org/downloads.
2. Download the latest version for your computer.
3. Open the downloaded file to start the installation.
4. **VERY IMPORTANT:** At the bottom of the installation screen, check the box that says **"Add Python to PATH"**. (If you forget this, the program might not work).
5. Click **"Install Now"** and wait for it to finish.

## Step 2: Install VPython

Now, we need to install the tool that draws the 3D shapes.

1. Open the command line on your computer:
   - **Windows:** Search for **cmd** or **Command Prompt** and open it.
   - **Mac:** Search for **Terminal** and open it.
2. A black screen will pop up. Type the following text exactly as it is and press **Enter**:

```
pip install vpython
```

3. Wait a minute. When you see "Successfully installed...", it means it is ready! You can close the black screen.
